THE ZERO-BAN PROTOCOL

The compliance protocol behind $50K/month in peptide & GLP-1 Meta ad spend, with *zero bans*.

Run this against your own account before your next launch. It's the exact protocol we run on every peptide and GLP-1 account before we spend a dollar. Work top to bottom, and don't skip the foundation.

5 CHECKPOINTS | RUN BEFORE LAUNCH | PEPTIDE · GLP-1 | REVISED OCT 30, 2026

> WHY BANS HAPPEN
>
> Bans aren't random. Meta is a social platform, and its whole job is keeping people on it and feeling good while they're there. Every rejection you'll ever get traces back to something that threatened that experience. Get that frame and the rest of this protocol makes sense.

00

FOUNDATION

Know your lane

Two completely different compliance lanes exist, and brands constantly run one while set up like the other. Figure out your lane before you build anything. Everything below assumes you got this right.

- **Lane A: research-use-only peptides.** No prescription involved, no LegitScript certification required.
- **Lane B: prescription / telehealth.** GLP-1, ED, hair loss, anything dispensed against a script. Meta requires telehealth providers and online pharmacies to hold active LegitScript certification, plus Meta's own authorization, before an ad promotes a prescription drug (Meta's Drugs and Pharmaceuticals standard). Ads that promote telehealth services generally, without promoting a drug, don't need that authorization.
- Confirm you are **not in the dangerous middle**: advertising pure peptides for human use with no legitimate prescription pathway, the highest-risk lane, where most catastrophic bans happen.

01

SETUP

Warm the account before you sell it anything

Do not launch a cold account, a new card, or a fresh business manager straight into a conversion campaign. You're not buying results in week one. You're buying a clean record.

- Run a **preliminary awareness campaign for 3–7 days** at a low daily budget.
- Confirm the **card processes** and the account can spend. Billing gets funky on new accounts in this vertical, so discover it on a low-budget test, not a scale push.
- Get **ad approvals on record**: a clean history, baseline data, and rapport with the platform before you ask it for anything expensive.
- Only graduate to a conversion campaign once you see **clean approvals, no rejections, no payment flags**.

"You're not buying results in week one. You're buying a clean record."

02

COPY

Write copy that doesn’t trip review

The headline and primary text are the most-scanned surface on your ad. Treat them as the most conservative part of the whole campaign.

- ✕ No scientific or clinical terminology in headlines and primary text.
- ✕ Don’t name the compound. Early on, avoid the word “peptide” in captions entirely.
- ✕ Don’t imply human usage or promise physiological outcomes; the line most people cross without realising it.
- ✕ No harsh claims and nothing that makes the reader feel bad about themselves. Shaming ads threaten the user experience, so Meta kills them.

The escalation principle: conservative copy on a cold account isn’t timid. It’s how you buy permission to be aggressive later. Lead with brand-level, lifestyle, benefit-adjacent language.

✕ REJECTED

“Our clinical-grade semaglutide peptide helps you lose up to 20 lbs in your first month, no diet, no gym.”

Why it died: names the compound, leans on clinical terminology, and promises a physiological outcome with a number: three review triggers stacked into one line, on an account with no history to defend it.

✓ COMPLIANT

“Ready to feel like yourself again? Here’s the approach our clients are using to get there, without the guesswork.”

Why it runs: benefit-adjacent, no compound named, no outcome promised, nothing that shames the reader. It sells the shift, not the substance.

03

CREATIVE

Creative that passes review

The review system looks at your creative just as hard as your copy. Our creative rules are stricter than Meta's written ones on purpose: on a cold account, the safest asset is the one with nothing to argue about.

- ✕ **No before-and-after body images for prescription GLP-1 or peptides. That's our house rule.** Meta no longer bans this in writing as of July 2026 (what changed). We still don't run it, because Meta's prescription-drug standard says nothing about imagery either way, and a body comparison sits one caption away from the rules Meta kept: no statements of inferiority about appearance, and no promises of specific results in a set timeframe without a qualifier.
- ✕ **GLP-1 specifically: no brand names on product images or vials.** Unbranded product only.
- ✓ **Sell the transformation without showing a transformation.** Show the change with objects, props, and symbolic before-and-afters: nothing about the human body, everything about the idea of change.
- ✓ Same escalation principle as copy: **conservative creative first, aggressive later**, once the account has approvals behind it.

✕ WE DON'T RUN

Split-screen before-and-after of a woman's midsection, with a vial labelled "Semaglutide" in the corner.

Why we don't run it: a body before-and-after breaks our house rule for prescription GLP-1, and the named compound on the vial makes it a prescription-drug ad, which Meta allows only from LegitScript-certified advertisers with Meta's authorization.

✓ COMPLIANT

One clean lifestyle frame: a pair of jeans that finally button, or an unbranded pen-style applicator on a bright kitchen counter.

Why it runs: the transformation is implied through objects, not bodies, and the product is unbranded. It passes review and still sells the outcome.

04

SCALE

Earn the right to run aggressive

Everything up to now has been buying permission. This is spending it, but carefully.

- Only once the account has **consistent approvals and real spend history**, start testing the aggressive angles that actually convert.
- **Test aggressive angles one at a time.** Push five at once and something gets flagged. You've learned nothing and spent your account's credibility.
- The real asset is **account history, not your creative library.** Every clean approval makes the next aggressive test survivable. A ban doesn't restart you at zero. It restarts you below zero.

THE 6 TRIGGERS WE DESIGN AROUND

1. **Before-and-after body imagery** for prescription GLP-1 and peptides: our house rule, not a written Meta ban since July 2026. `Creative`
2. **Naming the compound**: "peptide," "semaglutide," or a brand on a vial. `Copy · Creative`
3. **Promising a physiological outcome**: "lose X lbs," "boost testosterone." `Copy`
4. **Clinical or scientific terminology** in headlines and primary text. `Copy`
5. **Shaming or insecurity-baiting**: anything that makes the reader feel bad. `Copy · Creative`
6. **Going aggressive on a cold account** with no history to spend. `Warm-up · Scale`

● CLEARED FOR LAUNCH

We manage peptide and GLP-1 accounts spending $10K/month and up: compliance, creative, attribution, and scale. Book a free strategy call and we'll pressure-test your account against this exact protocol.

This is practitioner guidance based on how we run health-vertical ad accounts, not legal advice. Platform policies change; verify against Meta's current Health and Wellness and Drugs and Pharmaceuticals ad standards and your own compliance counsel before launch.
